

Client Requirements & Demo Scope

Nutrition Center Management Software

CLIENT REVIEW DOCUMENT | VERSION 1.0 | 03 OCTOBER 2026

Purpose and scope

This document describes the intended workflows, user-facing requirements, and current boundaries of the URJA Wellness Club management panel. It is intended for client review of the interactive demonstration and as a baseline for production planning.

1. Product Goal and Center Setup

- Provide one management workspace for daily nutrition-center operations: member relationships, visits, sales, collections, stock, expenses, and reporting.
- Present the URJA Wellness Club identity with a consistent wellness-oriented green theme, clear status colors, readable tables, and responsive layouts.
- Support center identity, branch context, staff names, coaches, packages, program types, batch times, and configurable business values.
- Provide a dashboard as the default signed-in landing page, with operational summaries and shortcuts to common tasks.

2. Users, Roles, and Access

- Provide a sign-in screen and a sign-out action. Demo credentials and role behavior must be clearly identified as demonstration behavior.
- Represent center roles such as administrator, manager, coach, and front-desk operator, with access appropriate to each role in a production deployment.
- Allow authorized administrators to create and maintain user profiles and role assignments.
- Record important user and operational actions in an activity log so changes can be reviewed.

3. Member Registration and Profile

- Create, view, edit, search, filter, and remove member records using name, mobile number, member identifier, coach, status, and other available fields.

- Capture contact information, date of birth, gender, address or area, referral source, program, coach, batch, joining date, package, start date, and expiry date.
- Track package fee, payments received, and outstanding balance. Recalculate the balance when member payment details change.
- Assign a stable member identifier and maintain profile details such as attendance, progress notes, visits, package history, and ledger activity.
- Support member status values such as active, expired, trial, and hold, and highlight upcoming expiries and birthdays.

4. Leads and Follow-up CRM

- Capture prospective member name, mobile, source, assigned coach, stage, last-contact date, notes, and planned next follow-up.
- Search and filter prospects by status and follow-up stage, including new, interested, visit planned, visited, joined, and no response.
- Allow staff to update lead details and convert a prospect into a member without losing useful relationship context.
- Show follow-ups due today and overdue follow-ups in operational views.

5. Attendance and Center Consumption

- Record member visits by date and time, with a search or barcode-ready check-in workflow.
- Support marking members present or absent, editing attendance where permitted, and reviewing daily attendance history.
- Update visit counts when attendance is recorded and prevent duplicate attendance entries for the same member and date where configured.
- Record center product or shake consumption against a visit and reflect consumed quantities in stock totals.
- Provide attendance summaries by day, member, batch, and coach for operational review.

6. Packages, Billing, and Receipts

- Maintain package duration and price, and calculate the expected membership end date from the selected start date and package duration.
- Create itemized bills for packages and products, calculate totals, discounts, amounts paid, and balances due, and assign a unique receipt or bill reference.
- Support payment methods such as cash, UPI, bank transfer, and cheque where configured by the center.
- Provide a printable invoice view and keep bill and payment history linked to the member account.

7. Payments, Dues, and Member Ledger

- Record payment date, amount, mode, member, receipt number, payment purpose, and remaining balance.
- Update member paid and pending totals when a payment is recorded, without allowing the outstanding amount to fall below zero.
- Maintain a chronological member ledger of charges and credits with a running balance and printable statement.
- Provide collection and outstanding-due summaries for daily center follow-up.

8. Products, Purchasing, and Inventory

- Maintain product name, category, unit, barcode or product code, purchase and selling prices, current quantity, minimum quantity, batch, and expiry date.
- Record supplier purchase invoices and line items, quantities, purchase rates, expiry details, and paid or due amounts.
- Increase inventory on purchase and reduce it on a recorded sale, consumption, or stock adjustment.
- Show low-stock, out-of-stock, and expiring-product alerts; support stock corrections with a reason and audit entry.
- Generate a stock list and inventory valuation or summary for review.

9. Expenses and Daily Closing

- Record expense date, category, amount, payment method, reference, and notes.
- Provide a daily closing workflow that summarizes opening cash, collections by payment method, expenses, cash counted, and any variance.
- Allow authorized staff to save and review a closing record for a business date.
- Retain closing history for manager review and period reporting.

10. Dashboard, Reports, and Search

- Show at-a-glance member totals, active members, today's visits and collections, outstanding dues, low stock, expiries, leads, and follow-up workload.
- Offer chart and tabular summaries for revenue, attendance, memberships, consumption, and staff performance where data is available.
- Provide global search for members, products, and receipts, with direct navigation to matching records.
- Allow the user to export selected operational reports as CSV and printable PDF files.

11. Reminders and Communications

- Identify members approaching refill or renewal, members with overdue balances, upcoming follow-ups, and other center-defined reminders.

- Provide message templates and audience segmentation for common cases such as welcome, payment reminder, renewal, and absence follow-up.
- Keep a record of messages composed or sent by the application when a messaging provider is connected.
- External delivery through WhatsApp, SMS, email, or push notifications requires approved provider accounts, credentials, and backend integration.

12. Member, Coach, and Guest Experiences

- Provide member-facing views for membership status, visits, package information, payments, and wellness progress, subject to identity verification.
- Provide coach-facing views for assigned members, attendance, progress measurements, follow-up notes, and schedules.
- Provide a guest registration workflow that captures contact consent and source before staff follow-up.
- Production mobile access, QR identity, and protected personal data require server-side identity, authorization, and API services.

13. Backup, Restore, and Export

- Persist demo business data in the current browser so changes remain after a page refresh on that browser and origin.
- Download a complete versioned JSON backup containing the center's demo datasets and restore from a valid backup file.
- Create a local browser snapshot and display its last saved time; label local-only storage accurately.
- Export available report records to CSV and PDF, and provide printable invoices or statements where implemented.
- Automated off-site backups, encryption at rest, recovery guarantees, and multi-device synchronization are production backend requirements, not provided by local browser storage.

14. Usability, Accessibility, and Data Quality

- Use consistent shared form controls for buttons, text inputs, text areas, selects, checkboxes, labels, dialogs, tables, and status indicators.
- Provide field labels, required-field feedback, validation messages, keyboard focus visibility, and accessible names for icon-only actions.
- Support common desktop and mobile viewport sizes with readable content, usable dialogs, and responsive data tables.
- Validate required contact and transaction fields, parse numeric values deliberately, and confirm destructive actions.
- Keep local dates and money formats clear and consistent with the center's configured locale and currency.

15. Demo Boundaries and Production Decisions

- The supplied panel is an interactive front-end demonstration using seeded sample records and browser localStorage; it is not a production multi-user database.
- Clearing site data, changing browser profile, or using another device can remove or separate local demo data. Download JSON backups before clearing browser data.
- Cloud backups, Google sign-in, WhatsApp delivery, live QR/barcode hardware, payment gateway processing, and secure cross-device user accounts are not activated without external services and credentials.
- Before production, confirm hosting, database, user roles, branch rules, retention policy, consent text, payment and messaging providers, backup schedule, and data migration needs.
- Client acceptance should include review of role permissions, common registration and collection workflows, attendance accuracy, stock reconciliation, exports, and mobile behavior.
